1 Introduction

For this project, many population-based optimization algorithms will be tested. These are Genetic Algorithm (GA) and Differential Evolution Algorithm (DE), Particle Swarm Optimization (PSO) and Sine Cosine Algorithm (SCA), Bat Algorithm(BA), Directional Bat Algorithm (DBA) and the Ant Lion Optimizer (ALO).

1.1 Genetic Algorithm

The GA is a heuristic search and optimization technique that simulates the process of natural evolution. The main operations of GA are Selection, Crossover, Mutation, and Elitism.

1.2 Differential Evolution

The DE algorithm employs the difference of two randomly selected parameter vectors as the source fo random variations for a third parameter vector. Some advantages of DE are: few numbers of control parameters which make it easier to calibrate or tune, it is inherently parallel, and it has a faster convergence. There are many strategies of DE, in this project 10 different strategies will be tested.

1.3 Particle Swarm Optimization

The PSO is inspired by the flocking and schooling patterns of birds and fish, the key point of PSO is that it keeps tracking the personal best and global best variables, and make the particles move toward those best values.

1.4 Sine Cosine Algorithm

The SCA created in 2015 is very similar to PSO. However, it only keeps track of only the global optimal value, and in each iteration, it introduces sine and cosine formula which multiply with a decreasing range value.

1.5 Bat Algorithm

The BA proposed by Yang in 2010 is based on swarm intelligence algorithm, it is inspired by the echolocation behavior of microbats, as all the population-based algorithms the BA tries to find the optimal value by exploration and exploitation. At the beginning of the iterations, the algorithm focuses more on exploration by selecting in each iteration one of the best solutions (local minimums) randomly, then it adds a random walk step to it when this is better than the global best it will be accepted as a new solution. At the end part of the iteration the algorithm focus more in exploitation by moving the bats toward the best global best.

1.6 Directional Bat Algorithm

The DBA proposed by Chakri in 2016 is based on BA, it claims to be an improved version of BA adding 4 modifications that enhance the exploitation and exploration. The 1st modification consists of directional echolocation which makes the bat move in 2 combined directions (global best and random selected) instead of only one direction to the global best. The 2nd modification consists in decrease the search space through the iterations. The 3rd modification changed the formula about how the pulse rate and loudness increase and increase respectively. The 4th modification makes the algorithm to accept the new solution more often (increase exploration) and update the global best whenever the bat's random walk produces a better solution than the global optimal value.

1.7 Ant Lion Optimizer

The ALO algorithm simulates the population of antlions and the population of ants together, it mimics the interaction between antlions and ants in the trap. First, the antlion population is initialized randomly, then the elite antlion is located based on the fitness (cost), then each ant select an antlion using roulette wheel and random walk around it, also the same ant random walk around the elite ant, after that the new position of ant is calculated based on the two random walks, at the end, the antlions will update their positions to the best fitness ants position, and the elite antlion is also updated.

2 Method

The GA, DE, PSO, SCA, BA, DBA, ALO algorithms are coded using C++ object-oriented programming. The implemented classes are Population, PopulationBenchmark, Functions, Runner, GeneticAlgorithm, DifferentialEvolution, ParticleSwarm, SineCosine, BatAlgorithm, DirectionalBatAlgorithm, AntLionOptimizer class. Additionally, python script with jupyter notebook is implemented to read the configuration parameters and call the C++ executable, then it collects the result, displays it in table and figures, and prints the output in latex format.

The obtained results are from **50** runs of each algorithm with the population size equal to **500**, and the generations or iterations equal to **500**, the number of dimensions is set to 30.

The computer used to run the project has the following specification: Intel Core i7-9750H 2.6GHZ up to 4.5GHZ with 16 GB of RAM

2.1 Configuration Parameters

All evolution-based algorithms are very defendant of its parameters. To ensure that the optimization algorithm works correctly, the parameters had to be calibrated manually,

the following tables show the result of the calibration:

The calibrated GA parameters are:

crossover rate	mutation rate	mutation value range	mutation precision	elitism rate
0.9	0.05	0.1	1	0.3

Table 1: Configuration parameters of GA obtained by manual tuning

The calibrated DE parameters are:

DE strategies	crossover rate	scaling factor F	scaling factor lambda
DE_best_1_exp	0.8	0.3	-
DE_rand_1_exp	0.9	0.1	-
DE_randbest_1_exp	0.9	0.4	0.4
DE_best_2_exp	0.9	0.25	-
DE_rand_2_exp	0.9	0.05	-
DE_best_1_bin	0.6	0.5	-
DE_rand_1_bin	0.8	0.2	-
DE_randbest_1_bin	0.7	0.5	0.5
DE_best_2_bin	0.8	0.4	-
DE_rand_2_bin	0.7	0.1	-

Table 2: Configuration parameters of DE obtained by manual tuning

The calibrated PSO parameters are:

c1	c2	w
1	1	0.7

Table 3: Configuration parameters of PSO obtained by manual tuning

SCA parameters from the research paper are:

a	r3
2	2

Table 4: Configuration parameters of SCA from the research paper

The calibrated BA parameters are:

r0	A0 min	A0 max (exploration)	alfa	gamma	f min	f max (exploitation)	ratio best
0.1	1	11	0.7	0.9	0	2	0.2

Table 5: Configuration parameters of BA obtained by manual tuning, the A0 Max was increased to enhance the exploration

The calibrated DBA parameters are:

r0	rinf	A0	Ainf	fmin	fmax
0.1	0.7	0.9	0.6	0	2

Table 6: Configuration parameters of DBA obtained by manual tuning

The ALO algorithm does not have any configuration parameter.

3 Results

The results of applying different optimization algorithms with 18 benchmarking functions are displayed in the following pages:

5 Conclusion

In this project many optimization algorithms have been implemented and tested, they are Genetic Algorithm, Differential Evolution Algorithm, Particle Swarm Optimization, Sine Cosine Algorithm, Bat Algorithm, Directional Bat Algorithm, and Ant Lion Optimizer. Many configurations using different population sizes and iterations have been tested. From the results, it can be observed that ALO won most of the time. However, it is much slower than other algorithms. Additionally, it can also be noticed that PSO runs much faster than other algorithms in numerous times. In summary, we can conclude that almost all of the studied algorithms are pretty good since after 500 iterations with a population size of 500 in most of them could find results that are very close to the optimal value. Despite this, one inconvenient of the evolutionary-based optimization algorithm is that the calibration of its parameters requires very tedious work. Though ALO can be the exception, this algorithm has the beauty of solving the problem without the requirement of configuration parameters, but the reason for why ALO performs better than another algorithm is still unknown, perhaps there is a hidden mathematical explanation that we don't understand yet.
